FULLSTACK WEB-DEVELOPER

PROFILE

I learned about software development from a family member, and was introduced to Nashville Software School. From there, I began exploring the world of programming. I was intrigued by the challenge and logical thinking incorporated with the field, and applied to a full-stack programming boot-camp. I enjoy learning everyday and evolving my skillsets to achieve goals. I am passionate about technology, working in a team, and very eager to continue to grow as a developer to allow ideas to come to life. I am excited for where this career path will take me, and to become a big part of the technology community.

MY PROJECTS

Furever-Friends (Front-End Project):
A pet adoption application that bridges the gap between user's and adoptable dogs located in the Greater Nashville area. Users can login, and can find dogs they are interested in. Users can then go to their own interested pet list and add notes to their favorite pets they have chosen.

The login, and landing page are done using REACT.js and utilizes Material UI for styling. There are minor overrides with CSS to perfect the look of my website. Material UI statically allowed me to create cards for each pet, and icons are in place in lue of traditional buttons. The available pets tabs is fetching from an external API from Pet Finder, and the interested pets tab's uses that data from the API to join the user that is logged into a join table so users can have their own interested pets and notes that can't be viewed by other users.

CAREER SUMMARY

Nashville Software School   *2019*
Software Developer

- Trained in Client and Server side Web-Development
- Proficient in Server Side development
- Brainstormed and constructed single-page applications with the use of JavaScript and REACT
- Implemented object-oriented programming through daily coding exercises and extended projects
- Authored version-control of projects through GitHub
- Drafted minor-scale console applications with C#
- Developed and performed quality assurance activities and unit testing
- Created and queried databases using SQL
- Constructed full-stack web-pages using ASP.NET, MVC, and Entity Framework
- Created and manipulated relational databases using SQL, and ADO.NET

The Perfect Batch (Full-Stack Application):
The perfect recipe tracker targeted toward users that often go "off the cuff" when it comes to making a recipe. The most common question when it comes to cooking is "how did you make this?" A user can create an account, and create recipes to track how they made "the perfect batch."

Identity Framework handles authentication, while ASP.NET Entity Framework creates a RESTful API to allows the user to create, edit, and delete recipes that have added to the application. It's an open source online recipe book that anyone can use to see the ingredients used in an creating the perfect meal..
